

Case: Mobile swerve-rotation-camera for observation

This swerve-rotation-camera is developed voor mobile police matters such as observation traffic, public places and buildings. The system has been used to observe for any vandalism during the world champions football.

In cooperation with our partner Vidit in Biegen (Germany) a mobile swerve-rotation-camera has been developed for application in police matters. This highgrade application is equipped with two integrated cameras, each operating independently. One camera gives a survey, the other zooms in on required details at the same time.

This system has specially been designed for outdoor applications and it can remotely be operated by a joystick. On a keyboard console the operator can add data which could be relevant for legal procedures. The camera is used for surveillance of traffic, guarding public places and buildings. During the world champions football in 2006 this camera has been used to observe supporters for any disorder during the match.
